CLAIM AMENDMENTS:

- 1. (Currently amended) An aqueous-liquid-absorbing agent, which is an aqueous-liquid-absorbing agent comprising water-absorbent resin particles as essential components, wherein the water-absorbent resin particles are obtained by a process including the steps of polymerizing a water-soluble ethylenically unsaturated monomer including acrylic acid and/or its salt in an amount of 50 to 100 mol% and have a crosslinked structure in their inside; with the aqueous-liquid-absorbing agent exhibiting an absorption rate (FSR) of not less than 0.2 g/g/s, a water absorption capacity (CRC) of 10 to 20 g/g, a saline flow conductivity (SFC) of not less than 400 x 10⁻⁷ cm³·s/g, and a wet porosity of not less than 20 %.
- 2. (Original) An aqueous-liquid-absorbing agent according to claim 1, which is a particulate shape and of which not less than 90 weight % is in the form of particles having particle diameters in the range of 150 to 600 μm .
- 3. (Previously presented) An aqueous-liquid-absorbing agent according to claim 1, wherein at least a portion of the water-absorbent resin particles are agglomerate particles.
- 4. (Previously presented) An aqueous-liquid-absorbing agent according to claim 1, wherein the water-absorbent particles are surface-crosslinked ones.
- 5. (Previously presented) An aqueous-liquid-absorbing agent according to claim 1, which further comprises a liquid-permeability-enhancing agent.

- 6. (Previously presented) A process for production of an aqueous-liquid-absorbing agent including water-absorbent resin particles as essential components, which process comprises the steps of: preparing an aqueous monomer solution including a water-soluble ethylenically unsaturated monomer and an internal-crosslinking agent of not less than 0.2 mol % in ratio to the monomer; and then polymerizing and internal-crosslinking the water-soluble ethylenically unsaturated monomer in the aqueous monomer solution to thereby form a hydrogel; and then extruding the hydrogel from a perforated structure having perforation diameters in the range of 0.3 to 6.4 mm to thereby pulverize the hydrogel to thus obtain pulverized gel particles; then drying the pulverized gel particles to thereby obtain the water-absorbent resin particles to treatment to enhance liquid permeability of the water-absorbent resin particles.
- 7. (Original) A process for production of an aqueous-liquid-absorbing agent according to claim 6, wherein at least a portion of the pulverized gel particles are agglomerates.
- 8. (Previously presented) A process for production of an aqueous-liquid-absorbing agent according to claim 6, which process further comprises the step of surface-crosslinking the water-absorbent resin particles.

Claim 9 (Cancelled)

10. (Previously presented) A process for production of an aqueous-liquid-absorbing agent according to claim 6, wherein the treatment for liquid permeability enhancement is carried out by adding a liquid-permeability-enhancing agent.

- 11. (Original) A process for production of an aqueous-liquid-absorbing agent according to claim 10, wherein the liquid-permeability-enhancing agent is at least one member selected from among polyvalent metal compounds, polycationic compounds, and inorganic fine particles.
- 12. (Previously presented) A process for production of an aqueous-liquid-absorbing agent according to claim 6, wherein the aqueous monomer solution has a monomer concentration of neither lower than 35 weight % nor higher than a saturated concentration.
- 13. (New) A process for the production of an aqueous-liquid-absorbing agent according to claim 6, wherein the water-soluble ethylenically unsaturated monomer is included in an amount of 50 to 100 mol %.
